

Terminal Deck for iOS — Encryption Self-Classification Statement

Asad Iqbal · Apple Developer Team 6U4VNX5W87 · Bundle ID dev.terminaldeck.ios

1. Product

Application	Terminal Deck (iOS)
Function	A remote client for terminal sessions running on the user's own computer. The app displays those sessions and sends the user's keystrokes to them.
Distribution	Apple App Store / TestFlight. Generally available to the public, sold or provided at retail without restriction, and designed for installation by the user without further support from the supplier.

2. Classification

ECCN	5D992.c
Authority	Self-classification as a mass market item under the Cryptography Note (Note 3 to Category 5, Part 2 of the Commerce Control List) and 15 CFR 740.17(b)(1).
Non-standard cryptography	None. The product implements no proprietary or unpublished cryptographic algorithm. Every primitive it uses is a published international standard, listed in section 3.
CCATS	Not applicable. A classification request is not required for mass market items using only standard cryptography.

3. Cryptographic functionality

The application establishes an authenticated, end-to-end encrypted channel between the user's phone and the user's own computer. Its purpose is confidentiality of the user's own terminal session as it crosses an untrusted relay; the relay carries ciphertext and holds no key.

Key agreement	X25519 elliptic-curve Diffie–Hellman — RFC 7748, 128-bit security level (255-bit curve)
----------------------	---

Handshake	Noise Protocol Framework, pattern IK (public specification, noiseprotocol.org)
Encryption	ChaCha20-Poly1305 AEAD — RFC 8439, 256-bit key
Key derivation	HKDF-SHA256 — RFC 5869, RFC 6234
Hash	SHA-256 — FIPS 180-4
Transport security	TLS as provided by the operating system
Implementation	Apple CryptoKit (the operating system's own cryptographic library). No cryptographic algorithm is implemented from scratch by this product.

4. What the product does not do

- It contains no proprietary, secret or non-standard cryptographic algorithm.
- It provides no cryptographic functionality to other applications; there is no API, SDK, library or toolkit exposed to third parties.
- It is not "cryptanalytic", does not perform key escrow or key recovery, and has no open cryptographic interface.
- Its cryptography cannot be modified, extended or reconfigured by the user.
- It is not designed or modified for government end-users, military use, or any specialised application.

5. Reporting

The applicant acknowledges the annual self-classification reporting obligation associated with License Exception ENC 740.17(b)(1), including the requirement to submit a report in CSV format to crypt@bis.doc.gov and enc@nsa.gov by 1 February covering items exported during the preceding calendar year, to the extent that obligation applies to this item.

Prepared for submission to Apple in support of the App Store Connect App Encryption Documentation requirement for `dev.terminaldeck.ios`.
